CS50.ai 🦆 ♥♥♥♥♥

ddb

Quack. I am CS50's duck debugger (ddb), an experimental AI for [rubberducking](#). Quack quack. My replies might not always be accurate, so always think critically and let me know if you think that I've erred. Conversations are logged for debugging's sake. Quack quack quack.

you

Hullo

ddb

Hello! How can I assist you with CS50 today?

you

This is an extract of my Flask app:
@app.route("/sections", methods=["POST"])
def sections():
data = request.get_json()
print(data)
sections = data['sections']
print(sections)
render_template("admin-dashboard.html", sections=sections)
return redirect("/")
However, the data in the sections place holder is not being displayed in the rendered template. Why?

ddb

It seems like you're not actually returning the rendered template, but instead redirecting to the root ("/") immediately. The `render_template` function doesn't actually send the HTML to the client, it just prepares it. You need to return this result for it to be sent to the client. Try replacing `render_template("admin-dashboard.html", sections=sections)` with `return render_template("admin-dashboard.html", sections=sections)`.
